Sunflower WMA GTR flooding for 2018-19 Waterfowl Season

The GTRs below will be prepared for flooding this season. Boards will be put into water control structures and valves closed to allow for accumulation of rain water only. No pumps are operational on Sunflower WMA at this time. Waterfowl habitat and hunting areas will be limited until we begin to receive large amounts of rain. Normally, mid to end of December and January is when suitable water levels begin to appear.

Green Ash GTR (#3) (FS Road 717)

Redline GTR (Fordice) (FS Road 703)

South GTR #8 GTR (FS Road 710) (northwest portion only)

“Slough / Wetland” Areas on Sunflower WMA

There are approximately 5,200 acres of low-lying sloughs, lakes, and wetlands on Sunflower WMA. Most of these areas have structures in them to allow for increased water retention. These areas are not shown on any map, but they are scattered across the 62,000 acre WMA. These areas provide better habitat and hunting opportunities than the GTRs.
